Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon the caroter substrates,

Claim 37; Page 127-129; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule controling an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by

```

the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas lea sp. diapophytoene dehydrogenase (CrtM1) enzyme used in the invention. (Updated on 07-AUG-2003 to correct OS field.) using microorganism having a nucleic acid molecule encoding enzymes in

High growth methanotrophic bacterial strain polypeptide #38.

High growth methanotrophic bacterial strain, Cl carbon substrate; enzyme; methano! Embden-Meyerhof carbon flux pathway; 168 RNA; pyrophospbate dependent phosphofrutchinase; nitrogen-containing compound; ammonia; nitrate; nitrite; nitrogen; pigment; oxygen; landfill; methane-containing environment; waste water treatment system; isoprenoid; nitrous oxide; terpenoid; animal feed; carotenoid; exopolysaccharide.

Methylomonas sp.

WC200220728-A2

```
The invention relates to a high growth methanotrophic bacterial strain, which grows on a Cl carbon substrate e.g. methane and methanol, and comprises a functional smadern Meyerboc Carbon flux pathway comprises a comprise a functional smadern Meyerboc Carbon flux pathway comprises a functional smadern Meyerboc Carbon of Lathway compound, or protein and for the biotransformation of a nitrogen-containing compound, production of a feed product comprising a protein, carbohydrates and a production of a feed product comprising a protein, carbohydrates and a production of a feed product comprising a protein, carbohydrates and a nitrites in methane-containing environments such as landfills, waste water treatment systems or anywhere that methane, oxygen and nitrates are present. The bacterial strain of the invention c.n be used as a centrifying agent for the conversion of nitrates are present. The bacterial strain of the invention c.n be used as a demittifying agent for the conversion of nitrates and a wide oride with methane or methanol as a carbon source. It is also used in the production of biomass including proteins, carbohydrates and a wide compounds, useful as pigments for insprenoid and carotenoid compounds, useful as pigments and as monomers in polymeric materials and compounds, useful as pigments and as monomers in polymeric materials and an invention (Updated on 07-MUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                   New high growth methanotrophic bacterial strain, useful for producing single cell proteins, grows on a Cl carbon substrate, and comprises a functional gene encoding in Embden-Meyerhof carbon pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 150-152; 157pp; English.

                                                                                                                                                                                                                                                                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new nucleic acid molecule encoding an isoprenoid biosynthetic enzyme isolated from Methylomonas 16a. The invention is useful for obtaining a nucleic acid molecule encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for regulating isoprenoid biosynthesis in an organism and for production recombinant organisms for producing various isoprenoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present mino acid sequence represents the Methylomonas 16a open reading frame 8 (ORR8) orthle invention, as described above

The present invention describes nucleic acid sequences encoding carotenoid biosynthetic enzymes (CBES). Also described: (1) a CBE polypeptides; (2) a chizeric gene (CG) containing a CBE linked to regulatory sequences; (3) host cell transformed with CG; (4) obtaining a nucleic acid that encodes a CBE; (5) products of method (4); (6) producting an omega-aldehyde-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing Carotenoids (Z); and (9) regulating carotenoid (Y); (8) producing C30 carotenoids, and are potentially useful as pigments and and C30 carotenoids, and are potentially useful as pigments and antioxidants, e.g. as feed additives. The present sequence represents a ctr. NCBE protein isolated from Methylomonas sp. strain 16a, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420

Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related polypeptides.

Claim 6; SEQ ID NO 1929; 192pp; French.

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.
monocytogenes and related organisms, and for studying genetic
color polymorphisms and other genomes. The present sequence is a protein
encoded by the genome sequence of the present invantion. Proteins
concoded by the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
for biosynthesis and biodegradation, especially biosynthesis of vitamin
BL2. The genome sequence and proteins encoded by it are also useful for
selecting compounds that regulate gene expression and cell replication
and modulate L. monocytogenes. related diseases. In addition, the genome
sequence and proteins encoded by it are useful in pharmaceutical and
vaccines compositions for the treatment or prevention of infections by L.
monocytogenes and related organisms. Note: The sequence data for this
control format directly from WIPO at
the control of the printed specification, but was obtained
the control of the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid comprising any one of the foll3 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a
                                                                                                                                                                                                477
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are useful for callular proliferation to isolate candidate molecules for rational forgulared for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPD at

Prodn of bleaching herbicide-resistant plants - by transformation with Erwinia phytoene desaturase gene the

Example 9; Page 11-13; 20pp; Japanese

The sequence of the Anabaena strain PCC7120 epsilon-carotene desaturase protein. The corresponding gene was used in a method for the production of plants resistant to epsilon-carotene desaturase inhibiting herbicides e.g. SAN306H, JBS2, etc., or phytocene desaturase inhibiting herbicides e.g. norflurazone, fluxidone, etc., by introducting into the plant a DNA sequence that encodes a polypeptide, preferably the Erwinia-derived phytoene desaturase e.g. the Euredovora crtI gene, or a variant e.g. the Anabaena sequence given in the specification, having a phytoene to contenting activity. The DNA sequence also contains a sequence coding for a transit peptide. (Updated on 27-AUG-2003 to correct OS field). (Updated on 16-OCT-2003 to standardise OS field)

Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.

Claim 2; SEQ ID NO 3220; 1205pp; French

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms; for gene analysis and for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or mirroorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Cemphinant production of the proteins practicularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes by proteins, vectors containing the genes and Ab are also useful the are sensitive to P. luminescens-encoded toxins or antibiotics) and as hopesticides. Other uses of the genes and the proteins are as virulence is subopesticides. Other uses of the genes and the proteins are as virulence luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins

2002-351711/38. N-PSDB; AAD35512 Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes ir the carotenoid biosynthetic pathway and which metabolize single carbon substrates.

Claim 19; Page 141-143; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a mucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which methodises single carbon substrates. The carotenoids have potent anti-oxidant properties useful in intermediates in the synthesis of steroids flavours and tragrances and compounds for potential electro-optic applications. The present sequence is propertied.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises the amino acid and coding sequence of a number of carotenoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents crt-related protein of the invention

```
pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), phyropene explase (crtE), zeaxanthin glucosyl transferase (crtX), phyropene synthase (crtX), phyropene synthase (crtX), phyropene synthase (crtX), phyropene synthase (crtX), phyropene synthase (crtX), phyropene synthase (crtX), and beta-carcene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (I) can be used for regulating caractenoid biosynthesis is altered in the organism, such that the carctenoid biosynthesis is altered in the organism. (I) and the genes encoding (I) are useful for converting phytoene to the carctenoids, for creating recombinant organisms that have the ability to produce various carctenoid compounds, and also for enhancing or manipulating carctenoid compounds, and also for producing gene products having enhanced or altered activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EQFMEQERKR FNALYPCITRDYSSLK----SFLSL-DLIKALPWLA---FPKSYFNNLGQ 175

Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostrics. The protein is also used in an assay for enzymatic studies and as a target for autibiotics. This sequence represents one of the novel S. aureus proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            125

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes nucleic acid sequences encoding carotenoid biosynthetic enzymes (CBEs). Also described: (1) a CBE polypeptides; (2) a chmeric gene (CG) containing a CBE linked to regulatory sequences; (3) host cell transformed with CG; (4) obtaining a nucleic acid that encodes a CBE; (5) products of method (4); (6) producting an omega-abroxy-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing carotenoids (2); and (9) regulating carotenoid biosynthesis in an organism. CBE sequences have antioxidant activity. CBSs can be used for microbial production of aldehyde- or carboxy-functionalised carotenoids and 30 carotenoids, and are potentially useful as pigments and antioxidants, e.g. as feed additives. The present sequence represents a CTM CBE protein isolated from Scaphylococcus aureus, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     67 DEMFELCERRSEDYLEFLPLSPMYRLLYDDRD-IFVYSDRENMRAELQRVFDEGTDGYEQ 125
